

PROPORTIONAL FLOW CHEMICAL FEED

Metering pump-based chemical feed systems can be made more efficient and economical with the addition of a Wingert-designed flow sensing control system. The flow system can pace a pump and react to flow rate changes. If the flow rate slows, the pump speed will be reduced. If the flow rate increases, the pump will inject more chemical. Whether your proportional feed needs are for sterilization fertilization, or another manufacturing process, J.L. Wingert can help you design a system that will assure proper chemical ratios without overdosage and chemical waste.
